 Introduction:

ADISINSIGHT

Company Agreements

In October 2013, Bristol-Myers Squibb licensed the exclusive Chinese marketing rights for benidipine from Kyowa Hakko Kirin. Financial details of the agreement were not disclosed/1/.

Benidipine appears to have been licensed to Deva (an EastPharma subsidiary) for commercialisation in Turkey, and to , Sun Pharmaceutical Industries for commercialisation in India.

Crinos (later Sirton Pharmaceuticals) had licensed benidipine for development in Italy. However, this agreement no longer appears to be active.

In March 2015, Sun Pharmaceutical Industries acquired Ranbaxy/2/.

Introduction

Benidipine is an orally bioavailable dihydropyridine antagonist of L-type, N-type and T-type calcium channels. The drug was developed by Kyowa Hakko (now Kyowa Hakko Kirin) for the treatment of essential hypertension and angina pectoris, and gained approval in Japan in 1991. It has subsequently been launched in Japan, China, Philippines and Turkey (as Coniel sup((R))), and in India (as Caritec sup((R))) for these indications.

In October 2008, Kyowa Hakko merged with Kirin Pharma to form Kyowa Hakko Kirin/3/.

Generic versions of Coniel sup((R)) were launched in Japan in July 2006, following expiry of patent protection in the region.

Key Development Milestones

Benidipine was approved in China in September 2008 for the treatment of angina pectoris, following the filing of an application for regulatory approval in 2007/4/. The drug had been launched in China for the treatment of hypertension in December 2004, after gaining regulatory approval in March 2004. Kyowa Hakko had launched benidipine in the Philippines for both indications by April 2002.

In July 2006, Deva was granted marketing authorisation for benidipine in angina pectoris and essential hypertension, and subsequently launched the product in that country during 2007. Ranbaxy launched the drug in India, in October 2000.

Kyowa Hakko announced in its 2003 annual report that a special investigation evaluating the efficacy and safety of long-term (1 year) administration of benidipine in 10 000 older patients with hypertension had been initiated. A second large-scale clinical trial in collaboration with Yamaguchi University had also been initiated to investigate benidipine in combination with one of three types of antihypertensives (beta-blockers, angiotensin II receptor blockers and antihypertensive diuretics) over a three-year period (COPE; NCT00135551). The effectiveness and safety of the three combination regimens was to be compared and evaluated. This trial enrolled 3501 patients with hypertension in Japan, and was completed in November 2010.

Benidipine was undergoing phase III clinical trials in Italy and phase II trials in Germany, the United Kingdom and the USA for angina pectoris and essential hypertension. However, development appears to have been discontinued in these countries.

TX PHARMACOLOGY OVERVIEW:

Pharmacodynamics:

Coronary and cerebral vasodilatory effects in vivo; marked BP-lowering effects; diuresis; natriuresis

Mechanism of action:

L-type calcium channel antagonists

L-type calcium channel modulators

Calcium channel antagonists

Calcium channel modulators

- Ion channel antagonists
- Ion channel modulators
 - Membrane glycoprotein inhibitors
 - Membrane transport protein inhibitors
 - Membrane glycoprotein modulators

ADISINSIGHT

TX CLINICAL OVERVIEW:

Route(s) of Administration: PO

Adverse events:

rare: Diarrhoea, Oedema.

Drug Interactions:

Unknown.

TX Adverse Events:

In 55 patients with essential hypertension receiving benidipine 2-8 mg/day for \leq 1 year, adverse events included lightheadedness (n = 1), diarrhoea (1) and peripheral oedema (1)/5/.

TX PHARMACOLOGY:

Pharmacodynamics (Hypertension):

Preclinical studies: the long term effects of ceronapril 40 mg/kg/day, AE 0047 20 mg/kg/day and benidipine 10 or 20 mg/kg/day were examined in stroke-prone spontaneously hypertensive rats. In treated rats, the incidence of cerebrovascular lesions was significantly depressed and their life-spans were extended compared to the untreated control rats. AE 0047 sustained BP under 210mm Hg without developing fibrinoid deposition on arterial walls. After benidipine, thickened arterial walls were observed and BP remained over 250mm Hg. In contrast to benidipine, ceronapril reduced the occurrence of smooth muscle proliferation and BP levels were similar to those of benidipine/6/.

Clinical studies: a randomised, single-blind, crossover study in 15 salt-sensitive patients with essential hypertension assessed the efficacy of benidipine and controlled release nifedipine on sodium-induced changes in systemic and regional haemodynamics. Oral benidipine 4-8 mg/day once daily for 73 days significantly reduced MAP and increased CI, superior mesenteric blood flow and renal blood flow during low and high sodium intake. Nifedipine 10-30 mg/day also significantly reduced MAP during low sodium intake, but had no effects on HR, CI or regional blood flow. The high sodium diet increased MAP, CI and terminal aortic flow (all $p < 0.05$), and reduced mesenteric and renal blood flows ($p < 0.05$) during nifedipine administration/7/.

In 15 patients with essential hypertension, benidipine 4 mg/day and trandolapril 1 mg/day for 12 weeks similarly decreased BP, and increased concentrations of nitrite/nitrate (NOx) and cGMP. Neither agent affected HR, lipid profiles and renal functions/8/.

In 10 elderly patients with essential hypertension undergoing mental arithmetic test, administration of oral benidipine 4mg od for 12 weeks significantly decreased 24-h BP, and had no marked effect on HR. However, the decrease in night-time DBP was not significant, and the decrease in night-time SBP was minimal. In benidipine recipients, the increase in SBP induced by mental arithmetic test was significantly decreased compared with baseline/9/.

Pharmacodynamics (Ischaemic Heart Disease):

Benidipine suppresses ischaemic ECG changes and attenuates ST and T wave elevation in animal models. Mild and long lasting dose-dependent increases in coronary sinus outflow and decreases in BP are seen at doses > 1 microg/kg IV. Benidipine protects the ischaemic canine myocardium and maintains global cardiohaemodynamics. Other animal studies have shown that benidipine exhibits preferential coronary and cerebral vasodilating activity, and has a longer duration of action than nifedipine or nicardipine.

TX THERAPEUTIC TRIALS:

Hypertension:

In patients with essential hypertension (n = 21), oral once daily benidipine 4 mg/day for 2 weeks produced a long lasting reduction in BP

compared with baseline/10/.

In an open, multicentre study in 78 patients with essential hypertension, monotherapy with oral benidipine 2-8 mg/day od for <= 1 year significantly decreased BP from baseline. Similar effect was achieved when benidipine was used in combination with other antihypertensive agents (n = 19) (details not provided). 42% of patients in the benidipine monotherapy group and 44% of patients in the combination therapy group had their BP normalised at 1 year (BP < 150/90mm Hg)/5/.

In a randomised study in 86 patients with essential hypertension, beta-blockers arotinolol, bisoprolol, ACE inhibitors captopril, imidapril and calcium antagonists nisoldipine and benidipine for 12 weeks significantly and similarly decreased 24h ambulatory BP. 24h HR decreased significantly with the beta-blockers arotinolol and bisoprolol. There were no differences in circadian and ultradian variations among the major first, second and third peaks of SBP, DBP and HR in patients receiving beta-blockers or ACE inhibitors. Calcium antagonists shortened the periodicity of ultradian variations in second and third peaks of SBP/11//9/.
