## Sequence Similarity Searching (BLAST/GETSIM)

The GETSIM and BLAST<sup>®</sup> run packages are available to search the PCTGEN database for protein and nucleotide sequence data by similarity (homology). BLAST is provided in PCTGEN with the permission of the National Center for Biotechnology Information (NCBI) of the National Library of Medicine (NLM). GETSIM is provided in PCTGEN by FIZ Karlsruhe GmbH, and is based upon the FASTA algorithm.

To initiate a BLAST or GETSIM search the following search codes have to be specified: SQP for searching peptide sequences (default), SQN for nucleotide sequences, or TSQN for searching peptide sequences translated from PCTGEN nucleotide sequences. The GETSIM or BLAST search can be run in offline BATCH mode or used as the basis of a current-awareness ALERT. The offline search mode offers an email notification option which allows users to see when batch search results are available for download. When using the SQN option, it is possible to specify whether single (SIN), complementary (COM), or BOTH strands should be searched. The options can be specified together with the search code, e.g., /SQN COM. If no search option is given, SIN (single) will be used by default for GETSIM, and BOTH (both) will be used by BLAST. Note that for the TSQN option generally both strands will be searched, i.e., for a single polypeptide query, the TSQN option will cover all six possible translations (three reading frames of both the single and the complementary nucleotide sequences). Nucleotide and protein sequences can be subjected to a similarity search in various ways. A query can be prepared with the query command and saved beforehand, it can be entered directly on the command line using RUN GETSIM/BLAST, or it may be uploaded from an ASCII file using the UPLOAD command. You may also use the Sequence Query Upload Wizard from STN Express version 8.4+. A diagram is generated that shows the similarity between the retrieved sequences and the query. The x-axis represents the number of answers with a specific degree of similarity (represented by y-axis). In addition, two values are given, the query self score value defining the maximum score value possible when the query is aligned to itself, and the score value of the best answer of the retrieved answer set. You have three possibilities to select the result answer set.

You can either:

- 1) Keep the complete answer set (ALL).
- 2) Keep a subset of the complete answer set by specifying a smaller number of just the top scoring answers.
- 3) Specify the minimum percentage of the self score value, to keep a subset of the complete answer set, where the answers have a better score than your chosen minimum percentage of the query self score value.

The generated L-number contains all answers or the specified subset of answers, but they are sorted by descending accession number. This L-number may be re-arranged by descending similarity score or descending percent identity. Just type "SOR SCORE D" to sort by descending similarity score or "SOR IDENT D" to sort by descending percent identity and the corresponding L-number at an arrow prompt.

It is possible to see the alignment between the retrieved sequence and the query sequence with the display format ALIGN (for GETSIM or for BLAST). The top line is the query sequence and the bottom line the hit sequence. The BLAST ALIGN format follows the standard convention for NCBI alignment displays. The GETSIM ALIGN format uses two dots to represent identical nucleotides/peptides, a blank if there is no match, and one dot to indicate a chemical "family" match. Gaps inserted in the query or answer sequence for alignment purposes are shown with an underscore.

In addition to the sequence alignment, a special format SEQO is provided in PCTGEN. The display format SEQO shows the corresponding original sequence which might include the nucleotide sequence of a PCTGEN record together with the protein sequence it expresses as given by the patent applicant.

## ADVANCED USER OPTIONS FOR BLAST

For the experienced user of BLAST<sup>®</sup>, a variety of options is available via the STN command line. Altering these parameters will have a profound effect on the outcome of the search. FIZ Karlsruhe strongly recommends that users are completely familiar with NCBI documentation before embarking on customizing any of these settings. For further information:

[http://blast.ncbi.nlm.nih.gov/Blast.cgi?CMD=Web&PAGE\\_TYPE=BlastDocs](http://blast.ncbi.nlm.nih.gov/Blast.cgi?CMD=Web&PAGE_TYPE=BlastDocs)

The advanced user options are specified with a single letter code preceded by a hyphen and followed by a blank and the required value, e.g. RUN BLAST L1 /SQN -E 0.1.

## Advanced User Options

Option	Switch	Values
1. Filter	-f	T (True), F (False), C (coiled-coil). Default value is T. If T is set, for peptides the SEG, and for nucleotides the DUST filter is employed. C represents the 'coiled-coil' filter.
2. Expectation Value	-e	Floating point number. (Default is 10)
3. Word Size	-w	11 (default) or 7-23 for nucleotides 3 (default) or 2 for peptides
4. Strand	-s	1 (sin), 2 (com) or 3 (both) default value is 3
5. Matrix	-m	BLOSUM62 (default), BLOSUM80, BLOSUM45, PAM30 or PAM70
6. Gap Penalty	-g	11 (peptides) (default) 5 (nucleotides) (default)
7. Gap Extension	-x	1 (peptides) (default) 2 (nucleotides) (default)
8. Penalty for nucleotide mismatch	-q	-3 (default)
9. Reward for nucleotide match	-r	1 (default)

## SEARCHING SEQUENCE DATA WITH THE GETSEQ RUN PACKAGE

Sequence information (amino acid and nucleic acid sequences) may be retrieved by using a variety of search fields available with the GETSEQ run package. The query may be first created with the QUERY command, and subsequently searched through the GETSEQ run package specifying the query L-number (e.g., RUN GETSEQ L9, if L9 represents the sequence query). The L-number may also derive from a previous sequence search in another STN database with biosequence search capabilities, e.g., the CAS REGISTRY<sup>SM</sup> file. The query may also be directly entered within the GETSEQ package at a colon prompt after GETSEQ has been initialized with the RUN command (i.e., RUN GETSEQ). Offline sequence searching is also available for GETSEQ searches.

**(2)** Enter 'HELP NUC' at an arrow prompt to display a table of the codes for nucleic acids.

## TYPES OF SEQUENCE SEARCHES

Sequence data for nucleic acid and protein sequences are displayed in the SEQ field with one-letter codes and the SEQ3 field with three-letter codes for proteins only.

Type	Definition	Search Code	Query Examples
Sequence Exact Protein	Search for sequences that match the query. <b>(2)</b>	/SQEP	QUE GAPGEK/SQEP QUE 'ALA-PHE-PHE-PHE-PHE'/SQEP

- (1)** The families of amino acid equivalents retrieved in protein family searches are:

P, A, G, S, T (neutral, weakly hydrophobic)  
 Q, N, E, D, B, Z (hydrophilic, acid amine)  
 H, K, R (hydrophilic, basic)  
 F, Y, W (hydrophobic, aromatic)  
 L, I, V, M (hydrophobic)  
 C (cross-link forming)

- (2)** Variability symbols are allowed.

(1) In addition, the caret (^) and the vertical bar (|) may be used. The caret is used at the beginning or at the end of a sequence to search for that sequence at the beginning or end of sequence field. The vertical bar is the symbol for alternation, i.e., it is used to separate alternate sequence queries.

- (1) By default, patent numbers, application and priority numbers are displayed in STN format. To display them in Derwent format, enter SET PATENT DERWENT at an arrow prompt. To reset display to STN format, enter SET PATENT STN.
- (2) Custom display only.
- (3) Use RUN BLAST first. See page 4, Similarity Search.
- (4) Use RUN GETSIM or RUN BLAST first. See page 4, Similarity Search.
- (5) Sequences in PCTGEN are given according to WST.25 of the WIPO.
- (6) SCAN must be specified on the command line, e.g., D SCAN or DISPLAY SCAN.

## SELECT, ANALYZE, and SORT Fields

The SELECT command is used to create E-numbers containing terms taken from the specified field in an answer set.

The ANALYZE command is used to create an L-number containing terms taken from the specified field in an answer set.

The SORT command is used to rearrange the search results in either alphabetic or numeric order of the specified field(s).

- (1) HIT may be used to restrict terms extracted to terms that match the search expression used to create the answer set, e.g., SEL HIT PA.  
(2) SELECT HIT and ANALYZE HIT are not valid with this field.  
(3) Appends /SQSP to the terms created by SELECT.  
(4) Used with a L-number created with BLAST and GETSIM.
